

Python strings

python

comp

- Exact match (equality comparison): ==, !=
- Partial match: in, not in
- Forward/backward match: startswith(), endswith()
- Order comparison: <, <=, >, >=
- Case-insensitive comparison: upper(), lower()
- Regex: re.search(), re.fullmatch()

string formatting

- string formatting <https://realpython.com/python-string-formatting/>
 - «string%s»%(param1)
 - «string {} {}».format(1param,2param)
 - «string {1}{2}{1}».format(1param,2param)
 - interpolación (f-string): f«string {name} {a + b}»
 - Template strings

f-strings (Literal String Interpolation)

- To create an f-string, prefix the string with the letter “ f ”. The string itself can be formatted in much the same way that you would with str.format(). F-strings provide a concise and convenient way to embed python expressions inside string literals for formatting.
- F-strings are faster than the two most commonly used string formatting mechanisms, which are % formatting and str.format().

```
val = 'Geeks'
print(f"{val}for{val} is a portal for {val}.")
```

```
import datetime

today = datetime.datetime.today()
print(f"{today:%B %d, %Y}")
```

Backslash Cannot be used in format string directly.

error

```
f"newline: {ord('\n')}}"
```

correcto

```
newline = ord('\n')
```

```
print(f"newline: {newline}")
```

string fill

- `ljust()`, `rjust()`, `center()`
- `%15s`, `%15-s`
- `{:15}`, `{:>15}`

/via: <https://www.delftstack.com/es/howto/python/python-pad-string-with-spaces/>

- `zfill()`

zero fill

- `n=42`
- `print(f'{n:05d}')`
- `print('%05d' % n)`
- `print('{0:05d}'.format(n))`
- `00042`

/via: <https://www.python-engineer.com/posts/pad-zeros-string/>

concatenate

- `s1+s2`
- `«%s %s»%(s1,s2)`
- `«-» .join([s1,s2])`
- `«{ }{ }» .format(s1,s2)`
